Bulletin No. 2-A

STRUCTURAL STEEL

Designed and Constructed by the Engineering Department of Viele, Blackwell & Buck

THE tables on the following pages show general details of the structural steel sections that are being rolled regularly by American mills. These are the sections which under normal conditions are usually carried in stock for prompt shipment. It will materially facilitate prompt quotations if inquiries state the section numbers and lengths and tonnage of each.

It is urged that specifications accompany all inquiries for quotations, but if conditions make this impracticable, we will submit base prices from which net prices may be determined for all sizes by adding the standard extras. Copy of the list of Standard American Extras will be furnished upon request.

Special sizes and shapes are available and complete particulars will be submitted promptly on receipt of specifications.

The Engineering and Construction Departments of Vielé, Blackwell & Buck are experienced in the design and erection of all manner of steel structures, and in cooperation with the Export Department, are prepared to consider work of this character. On receipt of necessary details we will prepare designs and submit drawings together with specifications to the mills with the object of advising foreign merchants and buyers as to cost and other particulars in connection with any project which they may have in view covering the erection of structural steel framings for buildings, bridges, towers, etc. After drawings have been accepted by our customers and contracts entered into, our organization is very well fitted to follow up the many details that are necessary at our New York Office, at the mills, and during transportation to the end that the material when received at destination will be satisfactory throughout and capable of erection with a minimum of labor.

Where it is desired that our work include the erection of the structures on the ground we will be pleased to furnish complete information on receipt of all of the particulars that are necessary for the preparation of estimates.

In cases where it is necessary for us to have a comprehensive report before intelligent engineering recommendations as to cost and feasibility can be made, and where it is impracticable for our customers to supply such a report, we are prepared to send one or more of our engineers to make all of the necessary investigations.

EXTRACTS FROM STANDARD SPECIFICATIONS

ADOPTED BY

THE ASSOCIATION OF AMERICAN STEEL MANUFACTURERS

STRUCTURAL STEEL

Grades. These specifications cover two classes of structural steel, namely:

Class A steel, to be used for railway bridges and ships.

Class B steel, to be used for buildings, highway bridges, train sheds and similar structures.

I. MANUFACTURE

Process. Steel for Class A shall be made by the open-hearth process. Steel for Class B may be made either by the open-hearth or by the Bessemer process.

II. CHEMICAL PROPERTIES

Chemical Composition. The steel shall conform to the following requirements as to chemical composition:

Elements Considered	Class A Steel	Class B Steel
Phosphorus, maximum, per cent.:		
Basic open hearth.....	0.04	0.06
Acid open hearth.....	0.06	0.08
Bessemer.....	0.10
Sulphur, maximum, per cent.....	0.05

III. PHYSICAL PROPERTIES

Tension Tests. The steel shall conform to the following requirements as to tensile properties:

Properties Considered	Class A Steel	Class B Steel
Tensile strength, lb. per sq. in.....	55,000-65,000	55,000-65,000*
Yield point, minimum, lb. per sq. in.....	0.5 tens. str.	0.5 tens. str.
Elongation in 8 in., minimum, per cent.....	$\frac{1,400,000}{\text{tens. str.}}$ †	$\frac{1,400,000}{\text{tens. str.}}$
Elongation in 2 in., minimum, per cent. (Fig. 2).....	22	22

* See "Modification in Tensile Strength," below.

† See "Modifications in Elongation," below.

Modification
in Tensile
Strength.

Class B steel may have tensile strength up to 70,000 pounds maximum, provided the elongation is not less than the percentage required for 65,000 pounds tensile strength.

Modifications
in Elongation.

For material over $\frac{3}{4}$ inch in thickness, a deduction of 1 from the percentage of elongation in 8 inches specified for Classes A and B in section above shall be made for each increase of $\frac{1}{8}$ inch in thickness above $\frac{3}{4}$ inch, to a minimum of 18 per cent.

For material under $\frac{5}{16}$ inch in thickness, a deduction of 2.5 from the percentage of elongation in 8 inches specified for Classes A and B in section above shall be made for each decrease of $\frac{1}{16}$ inch in thickness below $\frac{5}{16}$ inch.
